

## Multifunctional High Tg Epoxy Low-Flow Prepreg

---

51N is a non-DICY multifunctional epoxy low-flow prepreg system designed to provide high reliability through lead-free solder operations. The high decomposition temperature and high thermal stability of this material is ideal for use in complex rigid-flex fabrication and assembly operations where minimum resin flow is required.

### Features:

- Decomposition temperature > 350°C is ideally suited for lead-free solder processing and offers significant improvement over traditional FR-4 Epoxy systems.
- Multifunctional epoxy resin system with a Glass transition temperature (T<sub>g</sub>) of 170°C for optimized thermal cycling PTH reliability
- Improved bond adhesion over multiple thermal excursions results in better reliability through reflow and rework operations.
- Best-in-class thermal performance for an epoxy system with T<sub>260</sub> > 60 minutes, T<sub>280</sub> > 30 minutes and T<sub>300</sub> = 15 minutes
- Electrical and mechanical properties meet the requirements of IPC-4101/126 prepreg, modified to be “Low-Flow”
- Compatible with lead-free solder processing
- RoHS/WEEE compliant

### Typical Applications:

- Bonding multilayer rigid-flex boards
  - Finished PCB assemblies requiring excellent thermal stability
  - Dielectric insulators
  - Other applications where minimal and uniform resin flow is required
-

## Typical Properties:

| Property                                 | Units             | Value             | Test Method         |
|--|-------------------|-------------------|---------------------|
| <b>Electrical Properties</b>             |                   |                   |                     |

Results listed above are typical properties, provided without warranty, expressed or implied, and without liability. Properties may vary, depending on design and application. Arlon reserves the right to change or update these values.

## Availability:

| Arlon Part Number | Glass Style | Resin (%) | Thickness | Flow Range    |
|-------------------|-------------|-----------|-----------|---------------|
| 51N0672           | 106         | 72        | 0.0022"   | 60 - 120 mils |
| 51N0666           | 106         | 65        | 0.0017"   | 60 - 120 mils |
| 51N8065           | 1080        | 65        | 0.0032"   | 60 - 120 mils |
| 51N8060           | 1080        | 60        | 0.0027"   | 60 - 120 mils |

## Recommended Process Conditions:

Process inner-layers through develop, etch, and strip using standard industry practices. Bake inner layers in a rack for 60 minutes at 225°F - 250°F (107°C - 121°C) immediately prior to lay-up. Vacuum desiccate the prepreg for 8 - 12 hours prior to lamination.

### Lamination Cycle:

- 1) Pre-vacuum for 30 - 45 minutes
- 2) Control the heat rise to about 8°F - 12°F per minute (4.5°C - 6.5°C) between 210°F and 300°F (100°C and 150°C)
- 3) Lamination Pressure: 150-300 PSI (11-21 Kg/cm<sup>2</sup>) depending on complexity
- 4) Product temperature at start of cure = 360°F (182°C).
- 5) Cure time at temperature = 90 minutes
- 6) Cool down under pressure at ≤ 10°F/min (6°C/min)

Drill at 350-400 SFM. Undercut bits are recommended for vias 0.023" (0.9cm) and smaller

De-smear using alkaline permanganate or plasma with settings appropriate for epoxy; plasma is preferred for positive etchback

Conventional plating processes are compatible with 51N

Standard profiling parameters may be used; chip breaker style router bits are not recommended

Bake for 1 - 2 hours at 250°F (121°C) prior to solder reflow or HASL
